Emily Agree, PhD is a professor and researcher at Johns Hopkins University. Dr. Agree is an experienced sociologist and demographer of aging, and has worked in the demography of aging field for over twenty-five years. Dr. Agree's research reflects her longstanding interest in the ways in which population aging affects the health of the older population, as well as the adaptation of families to the longevity of older parents and relatives. In the United States, she has an active program of research focusing on the use of assistive technology as a part of community based long term care arrangements. Her interests in population aging and health have led her to study the measurement of disability in population based surveys, and she is now a member of the leadership team for the new National Health and Aging Trends Study (NHATS). She also is co-principal investigator on an NIA-funded project to study age differences in the use of the internet to seek health information (R01AG026430).
